E	Resolved Problems Infected wound (Noted 3/15/2010) Infection and inflammatory reaction due to other inter Sunken chest (Noted 6/17/2009)	ernal orthopedic device,	implant, and graft (Not	ed 7/27/2009)
¥	Results XR CHEST PA AND LAT - Final result (06/20/2012 1 Specimen	2:58 PM CDT)		
	Impressions IMPRESSION: Stable radiographic appearance of t	the chest.		Performed At LURIE CHILDREN'S HOSPITAL OF CHICAGO
	Narrative DATE: 6/20/2012			Performed At LURIE CHILDREN'S HOSPITAL OF CHICAGO
	EXAM: AP AND LATERAL CHEST			
	INDICATION: History of pectus excavatum repair			
	COMPARISON: 8/18/2011			
	FINDINGS: Postsurgical changes are seen followi	ing Nuss bar placemen	t for pectus	

FINDINGS: Postsurgical changes are seen following Nuss bar placement for pectus excavatum repair. The visualized hardware is intact with no evidence of fracture or complication. There are no focal pulmonary infiltrates or pleural effusions. There is minimal scarring seen at the lung bases, greater on the right than the left. The heart size and pulmonary vascularity are normal. The visualized skeleton is stable in appearance.

Procedure Note

Interface, Rad\_ Result (Inactive) - 06/20/2012 1:23 PM CDT DATE: 6/20/2012

EXAM: AP AND LATERAL CHEST

INDICATION: History of pectus excavatum repair

COMPARISON: 8/18/2011

FINDINGS: Postsurgical changes are seen following Nuss bar placement for pectus excavatum repair. The visualized hardware is intact with no evidence of fracture or complication. There are no focal pulmonary infiltrates or pleural effusions. There is minimal scarring seen at the lung bases, greater on the right than the left. The heart size and pulmonary vascularity are normal. The visualized skeleton is stable in appearance.

IMPRESSION: Stable radiographic appearance of the chest.

### XR CHEST PA AND LAT - Final result (08/18/2011 10:51 AM CDT)

Specimen

Impressions IMPRESSION: Stable positioning of the two Nuss bars with no radiographically evident acute cardiopulmonary process. Minimal blunting at the bilateral costophrenic angles, either small pleural effusions or pleural thickening.	Performed At CHILDREN'S MEMORIAL HOSPITAL
Dictated by: C. Wickman, M.D. Study viewed and discussed with resident by: J. Nicholas, M.D. Report reviewed by: J. Nicholas, M.D.	
Narrative	Performed At
PA and lateral view of the chest INDICATION: 20-year-old with Nuss bar status post pectus excavate them repair.	CHILDREN'S MEMORIAL HOSPITAL
INDICATION: 20-year-ord with Nuss bar status post pectus excavate them repair.	
COMPARISON: 3/11/2010 and 2/25/2010	
FINDINGS: No significant change in the two intact Nuss bars are noted. The cardiothymic silhouette and pulmonary vasculature appear normal. No focal consolidation or pneumothorax is seen. A subtle stranding opacity at the left costophrenic angle appears less prominent than in the prior study, likely representing scarring or minimal atelectasis. Minimal blunting of the lateral costophrenic angles is unchanged, left greater than right, compatible with mild pleural thickening. Osseous structures are unchanged.	
Procedure Note Interface, Rad_ Result (Inactive) - 08/18/2011 11:06 AM CDT	

PA and lateral view of the chest

INDICATION: 20-year-old with Nuss bar status post pectus excavate them repair.

COMPARISON: 3/11/2010 and 2/25/2010

FINDINGS: No significant change in the two intact Nuss bars are noted. The cardiothymic silhouette and pulmonary vasculature

appear normal. No focal consolidation or pneumothorax is seen. A subtle stranding opacity at the left costophrenic angle appears less prominent than in the prior study, likely representing scarring or minimal atelectasis. Minimal blunting of the lateral costophrenic angles is unchanged, left greater than right, compatible with mild pleural thickening. Osseous structures are unchanged.

#### IMPRESSION:

Stable positioning of the two Nuss bars with no radiographically evident acute cardiopulmonary process. Minimal blunting at the bilateral costophrenic angles, either small pleural effusions or pleural thickening.

## XR CHEST PA AND LAT - Final result (07/15/2009 1:25 PM CDT)

Specimen

Impressions	Performed At
IMPRESSION: Minimal decrease in right pleural effusion, stable moderate left pleural effusion.	CMH LAB
Improved right basal compressive atelectasis, stable patchy and linear compressive basilar atelectasis.	
No new abnormality.	
Narrative	Performed At
DATE: July 15, 2009	CMH LAB
EXAM: PA and lateral views of the chest	
INDICATION: Bilateral pleural effusions following pectus repair.	

COMPARISON: 7/7/2009

FINDINGS: Two pectus repair bars are again seen traversing the anterior chest. There are moderately large bilateral pleural effusions, slightly decreased on the right, unchanged on the left. The right lung base is better aerated than previously. Patchy and linear compressive atelectasis is again seen on the left. The upper lung fields are clear.

There is no evidence for pneumothorax. The cardiac silhouette is not enlarged. Mild scoliosis is again seen.

EXAM: CT CHEST WITHOUT CONTRAST

INDICATION: Pectus excavatum

COMPARISON: No comparison

TECHNIQUE: Helically acquired images of the chest were obtained without intravenous nonionic contrast material injection.

FINDINGS:

The cardiac size is normal. The heart is shifted into the left mediastinum. The great vessels are normal in appearance. No pericardial effusion is identified.

There is no mediastinal, hilar, or axillary lymphadenopathy, seen on this unenhanced chest CT.

Four 5 mm or less nodular opacities are seen, two in the left lower lobe, one in the right lower lobe and one in the right upper lobe. The lungs are otherwise clear. There is no focal consolidation or pneumothorax. No pleural effusion is seen.

There is pectus excavatum deformity. The Haller index measures 5.4.

Specimen

Impressions IMPRESSION: Stable radiographic appearance of the chest.

Narrative DATE: 6/20/2012

-, -, -

EXAM: AP AND LATERAL CHEST

INDICATION: History of pectus excavatum repair

Performed At

LURIE CHILDREN'S HOSPITAL OF CHICAGO

Performed At LURIE CHILDREN'S HOSPITAL OF CHICAGO

#### COMPARISON: 8/18/2011

FINDINGS: Postsurgical changes are seen following Nuss bar placement for pectus excavatum repair. The visualized hardware is intact with no evidence of fracture or complication. There are no focal pulmonary infiltrates or pleural effusions. There is minimal scarring seen at the lung bases, greater on the right than the left. The heart size and pulmonary vascularity are normal. The visualized skeleton is stable in appearance.

#### Procedure Note

Interface, Rad\_ Result (Inactive) - 06/20/2012 1:23 PM CDT DATE: 6/20/2012

EXAM: AP AND LATERAL CHEST

INDICATION: History of pectus excavatum repair

COMPARISON: 8/18/2011

FINDINGS: Postsurgical changes are seen following Nuss bar placement for pectus excavatum repair. The visualized hardware is intact with no evidence of fracture or complication. There are no focal pulmonary infiltrates or pleural effusions. There is minimal scarring seen at the lung bases, greater on the right than the left. The heart size and pulmonary vascularity are normal. The visualized skeleton is stable in appearance.

IMPRESSION: Stable radiographic appearance of the chest.

Dictated by: C. Wickman. M.	Dictated by: C. Wickman, M.D.						
	with resident by: J. Nicholas, M.I	D.					

Narrative	Performed At
PA and lateral view of the chest	CHILDREN'S MEMORIAL HOSPITAL

INDICATION: 20-year-old with Nuss bar status post pectus excavate them repair.

COMPARISON: 3/11/2010 and 2/25/2010

FINDINGS: No significant change in the two intact Nuss bars are noted. The cardiothymic silhouette and pulmonary vasculature appear normal. No focal consolidation or pneumothorax is seen. A subtle stranding opacity at the left costophrenic angle appears less prominent than in the prior study, likely representing scarring or minimal atelectasis. Minimal blunting of the lateral costophrenic angles is unchanged, left greater than right, compatible with mild pleural thickening. Osseous structures are unchanged.

Procedure Note

#### Interface, Rad\_ Result (Inactive) - 08/18/2011 11:06 AM CDT

PA and lateral view of the chest

INDICATION: 20-year-old with Nuss bar status post pectus excavate them repair.

#### COMPARISON: 3/11/2010 and 2/25/2010

FINDINGS: No significant change in the two intact Nuss bars are noted. The cardiothymic silhouette and pulmonary vasculature appear normal. No focal consolidation or pneumothorax is seen. A subtle stranding opacity at the left costophrenic angle appears less prominent than in the prior study, likely representing scarring or minimal atelectasis. Minimal blunting of the lateral costophrenic angles is unchanged, left greater than right, compatible with mild pleural thickening. Osseous structures are unchanged.

#### IMPRESSION:

Stable positioning of the two Nuss bars with no radiographically evident acute cardiopulmonary process. Minimal blunting at the bilateral costophrenic angles, either small pleural effusions or pleural thickening.

Dictated by: C. Wickman, M.D. Study viewed and discussed with resident by: J. Nicholas, M.D. Report reviewed by: J. Nicholas, M.D.

## XR CHEST PA AND LAT - Final result (02/25/2010 1:45 PM CST)

Specimen

bilateral pleural effusion Stable position and appear Dictated by: K. Wrigley,	n lateral costophrenic angles, l hs. Minimal left basilar atelect rance of the two pectus bars. MD with resident by: J. Mitchell,	asis.	Performed At CMH LAB		
Report reviewed by: J. Mit	chell, M.D.				
Narrative EXAM: Frontal and lateral			Performed At		
	CNEST		CMH LAB		
DATE: 2/25/2010					
INDICATION: Pectus excava	itum, Status post Nuss procedure				
COMPARISON: 9/9/2009					
FINDINGS: Two pectus excavatum repai	r bars are stable in position.				
Heart size is normal. The	pulmonary vasculature is normal				
Blunting of the costophrenic angles bilaterally has decreased. Minimal blunting remains, left greater than right. There is minimal left basilar atelectasis. No focal consolidation or pneumothorax.

IMPRESSION: Min <sup>.</sup> effusion.	imal decrea	se in right pleural effusion, s <sup>.</sup>	table moderat	e left pleural	CMH LAB
Improved right basilar atelecta		essive atelectasis, stable patcl	ny and linear	r compressive	
No new abnormal	ity.				

DATE: July 15, 2009

EXAM: PA and lateral views of the chest

INDICATION: Bilateral pleural effusions following pectus repair.

COMPARISON: 7/7/2009

FINDINGS: Two pectus repair bars are again seen traversing the anterior chest. There are moderately large bilateral pleural effusions, slightly decreased on the right, unchanged on the left. The right lung base is better aerated than previously. Patchy and linear compressive atelectasis is again seen on the left. The upper lung fields are clear.

There is no evidence for pneumothorax. The cardiac silhouette is not enlarged. Mild scoliosis is again seen.

## XR CHEST PA AND LAT - Final result (06/17/2009 4:15 PM CDT)

Specimen

Impressions IMPRESSION: Interval development of large bilateral pleural effusions and possible bibasilar atelectasis.	Performed At CMH LAB
Dr. Barsness was called about the findings at 5:35 pm, June 17, 2009.	
Dictated by: C. Singh, M.D. Study viewed and discussed with resident by: T.Ben Ami, M.D. Report reviewed by: T.Ben Ami, M.D.	
Narrative	Performed At
DATE: 6/17/2009	CMH LAB
EXAM: CHEST X-RAY PA LATERAL VIEWS TIME: 16: 05 hours	
INDICATION: Pectus excavatum, status post Nuss procedure, evaluate bar position and lung fields	
COMPARISON: 6/2/2009	
FINDINGS:	
There is interval development of large bilateral pleural effusions with possible bibasilar atelectasis. Mild perihilar interstitial prominence is also present. The cardiomediastinal silhouette is unremarkable. Metallic surgical hardware is again seen with slight difference in orientation of the horizontal limbs. The mediastinal drain has been removed in interim

Dictated by: A. Popescu, M.D. Study viewed and discussed with fellow by: C. Rigsby, M.D. Report reviewed by: C. Rigsby, M.D.

Narrative

DATE: 3/26/2009

Performed At

EXAM: CT CHEST WITHOUT CONTRAST

INDICATION: Pectus excavatum

COMPARISON: No comparison

TECHNIQUE: Helically acquired images of the chest were obtained without intravenous nonionic contrast material injection.

FINDINGS:

The cardiac size is normal. The heart is shifted into the left mediastinum. The great vessels are normal in appearance. No pericardial effusion is identified.

There is no mediastinal, hilar, or axillary lymphadenopathy, seen on this unenhanced chest CT.

Four 5 mm or less nodular opacities are seen, two in the left lower lobe, one in the right lower lobe and one in the right upper lobe. The lungs are otherwise clear. There is no focal consolidation or pneumothorax. No pleural effusion is seen.

There is pectus excavatum deformity. The Haller index measures 5.4.

Specimen

Impressions			Performed At						
IMPRESSION:			CMH LAB						
Stable postoperative findin	ngs. No acute process is identif	ied.							
Narrative	Narrative Performed At								
CHEST PA AND LATERAL	11 March 2010		CMH LAB						
Compared with February 25, Nuss bars. The heart which	2010, there has been no change is anchored on the right remain	in the positions of the 2 s rotated upward.							
The heart size remains normal. A strand-like opacity in the left lateral base which may represent scarring or minimal subsegmental atelectasis is unchanged. No change in blunting of the lateral costophrenic angles, left greater than right. No significant focal consolidation. No pneumothorax.

# Plan of Treatment - documented as of this encounter

Not on file

Performed At Impressions IMPRESSION: No change in the orientation or appearance of the pectus repair our is CMH LAB compared to prior study of July 29, 2009. Chronically blunted left costophrenic sulcus and to a lesser degree the right representing either chronic effusions or pleural scarring not significantly changed from the prior study. Performed At Narrative DATE: September 9, 2009 at 1603 hours CMH LAB EXAM: Chest, PA and lateral views CLINICAL INDICATION: pectus excavatum repair COMPARISON: July 29, 2009 FINDINGS: Two pectus excavatum repair bars are seen oriented transversely across the lower chest. The bars are unchanged in their position with anchor sutures seen at each side. Sutures appear intact. Blunting and opacification of the left costophrenic sulcus is unchanged. A lesser degree blunting is seen in the right costophrenic sulcus as well. Heart is normal size. The lungs are well expanded and clear. 	Impressions			Performed At			
	IMPRESSION: Minimal decrease effusion.	se in right pleural effusion	ı, stable moderate left pleu	ral CMH LAB			
	Improved right basal compressive atelectasis, stable patchy and linear compressive basilar atelectasis.						
	No new abnormality.						
	Narrative			Performed At			
	DATE: July 15, 2009			CMH LAB			
	EXAM: PA and lateral views	of the chest					
	INDICATION: Bilateral pleu	ural effusions following peo	ctus repair.				
	COMPARISON: 7/7/2009						
	FINDINGS: Two pectus repair bars are again seen traversing the anterior chest. There are moderately large bilateral pleural effusions, slightly decreased on the right, unchanged on the left. The right lung base is better aerated than previously. Patchy and linear compressive atelectasis is again seen on the left. The upper lung fields are clear.						
	scoliosis is again seen.		lhouette is not enlarged. Mi
